## TSPi Test Log Instructions - Form LOGTEST

Purpose	-	The test log contains a summary of the tests run and the results
		obtained.
	-	With the test log data, you can readily determine which tests were
		run and which found the most defects.
	-	You can also determine the test run time and the defects found
		per testing hour.
	-	Data from this log can help you select the most efficient strategy
		for regression testing modified programs.
General	-	Use the log to track all unit, integration, and system testing.
	-	A test run is an uninterrupted run of the test.
	-	When a test must be stopped, either to fix the program being
		tested or to change the test materials, that test run is concluded.
	-	When the test is resumed after the change, record this as a new
		test run.
Header	-	Enter your name, date, team name, and instructor's name.
	-	Name the part or assembly and its level.
	-	Enter the cycle number.
Date	-	Enter the date each test was run.
Test	-	Uniquely identify each test.
	-	Use the same name or number as in the test plan.

Product	- Name the product being tested.
Start	- Enter the time when the test was started.
Stop	- Enter the time when the test was stopped, either because it
	finished successfully or was aborted for any program or test-related
	reason.
Interruption Time	- If the test was temporarily suspended for a reason not connected
	with the program, that is interruption time.
	- For example, the tester took a break.
Delta Time	- The time between starting and stopping the test, less interruption
	time.
Problems	- The number of test problem reports
	- If one or more problems is determined to be a defect, note that
	under comments.
Comments	Briefly note the test results. For example
	- the test finished successfully
	- the test was completed, but the result was incorrect
	- the test failed with 3 problems, 1 defect
	- where possible, give additional information on test results, test
	configuration, or anything else that would permit reproducing the
	test results.
